                                                                                                                                                                                                                                                                                                                               Hedge PJ;
                                                                                                                                                                                                                                                         (UYJO) (UYJA) (UZAH) (CANC-) (
```

The invention relates to a novel method for detecting Adenomatous polyposis Coli (APC) protein in a sample. The method involves contacting the sample with antibodies which specifically binds to the 2813 amino acid form of the human APC protein, or to a mutant APC protein, and detecting an APC-antibody complex. Mutations in the APC gene play a role in tumorigenesis, indicating that it is a tumour suppressor gene. It is cocated on chromosome 521, which corresponds to the FAP (familial adenomatous polyposis) locus. FAP is an autosomal dominant inherited disease in which affected individuals develop hundreds to thousands of adenomatous polypes in the colon and rectum, some of which progress to malignancy. The FAP locus is often found to be deleted in sportatio (i.e., non-familia) adenomas and carcinomas, and chromosome 5q deletions have also been observed in tumours of the lung, breast, colon, rectum, non-familia) adenomas and carcinomas, and chromosome 5q deletions have also been observed in tumours of the lung, breast, colon, rectum, lung been observed in tumours of the lung, breast, onlon, rectum, labo been observed in tumours of the lung, breast, colon, rectum, labo been observed in tumours of the lung, breast, colon, rectum, labo been observed in the development of the plant mutations in the APC gene play a ker, TBI, TB2, and MCC, it is thought that mutations in the APC gene play useful for detecting APC protein and its mutati forms in foeral tissue, placental tissue, aminotic fluid, blood, serum or a tumour sample. The method is useful for diagnositing or prognosing neoplastic tissue, for detecting a genetic predisposition to cancer, for detecting germine a genetic predisposition to cancer, for detecting germine a genetic predisposition to cancer, for detecting germine a genetic predisposition to cancer, for detecting germine and spiles variant of the human APC protein.

This variant is more abundant than the 2742 amino acid variant (AAB23012)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                 The invention describes a transgenic Drosophila whose genome comprises the full-length human colon cancer gene Adenomatous Polyposis Coli (APC) allowing regulated mis-expression of the APC gene resulting in developmental abnormalities. The transgenic files are used to screen and validate efficacy of anticancer drugs, to identify new target proceins interacting with beta-catenin, genes which interact with human APC, to study the biochemical function of human APC and to identify additional components of the Drosophila Wat/Wg signalling pathway. In particular the files are used to screen potential drugs against colon cancer. This is the amino acid sequence of the human adenomatous polyposis coli (APC) protein DNA encoding which is incorporated in the transgenic files

This sequence represents a human APC protein which is used in a method of identifying candidate drugs for use in familial adenomatous polyposis (TAPP) patients, or patients with increased risk of developing cancer. The protein can also be used to determine the presence or absence in a cell of wild type adenomatous polyposis coli (APC) gene or a downstream or protein in the APC transcription regulatory pathway. This method involves introducing a TCF-responsive reporter gene into the cell, and measuring transcription of the reporter gene where a cell which supports active downstream protein of the APC transcription regulatory pathway. The protein can also be used in a method of diagnosing cancer in a sample cancer or other cancer associated with TAPP, comprising the beta-catenin binding site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ASSGQIDILERLKELNIDSSNPPGVKIRSKMSLRSYGSREGSVSRSGECSPVPMGSFPR

The present sequence is a transcriptional activation protein related to the invention. The invention relates to human Tcf4 by proteins and their corresponding cDNA molecules which encodes transcriptional activation activation in colorectal peithelial cells. Moreover it has been found that adenomatous polyposis coli (APC) regulates this transcription in colorectal peithelial cells. Moreover it has been found that adenominated peithelial cells. Moreover it has also provides a recombinant adenovimus, Ad-Mini-Me ie., ApC Minus its also provides a recombinant adenovimus, Ad-Mini-Me ie., ApC Minus its almino- and carboxyl -terminal Ends which expresses a fusion protein, creen fluorescent protein (GFP)/CAPC containing GPP fused to the central chinch appoptosis or treating colorectal cancer. These fusion proteins are useful for treating cancer. e.g. colorectal cancer, and other cancers are useful for treating cancer. Howan Tcf-4 cDNA provides an increased risk of developing cancer. Human Tcf-4 cDNA provides and excellent system for screening agents for their ability to promote callery. Human regration in cells or in an animal. It also provides metals cancer in a sample suspected of being neoplastic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

The present sequence is a protein involved in cancer diagnosis associated with APC or beta-catenin mutations. Human Tcf-4B protein expressed in colorectal epithelium transactivates transcription when associated with beta-catenin. Adenomatous polyposis coli (APC) regulates this transcriptional activation, alleast in part by binding to beta-catenin. Determining wild-type APC protein for diagnosing cancer comprises introducing a Tcf responsive reporter gene having upstream sequences of any into a cell and measuring transcription of the reporter gene. The candidate drug identified is useful for treating familial adenomatous polyposis patients with APC or beta-catenin mutations and patients with medulloblastoma, desmoid tumour, osteoma, breast, head and neck brain, 9 9 MAAASYDQLLKQVEALKMENSNLRQELEDNSNHLTKLETEASNMKEVLKQLQGSIEDEAM .; 0 Length 2973; Indels . 9 DB 3; 2; Mismatches Score 14526; Pred.                                                                                                                                                                  AAQ72297 is a cDNA isolated from the human adenomatous polyposis coli (APC) gene, it encodes the tumour repressors described in AAR63507 and AAR63508. Determination of alterations in APC or its expression products, can be used for the diagnosis and prognosis of cancer e.g. colorectal, lung and breast tumours; and for determining predisposistion to certain cancers such as familial adenomatous polyposis (FAP) and Gardner's syndrome. The wild type APC gene (or a part of it) can be used therapeutically to restore gene function, while primers and probes derived from the cDNA (AAQ72313-400 and AAQ72541-569) can be used to detect mutations. Also APC proteins or analogues can be administered to compensate for a defective gene, and epithelial cells, of transgenic animals carrying a mutated APC allele are useful for detecting therapeutic agents able to suppress tumorigenesis. (Updated on 25-MAR-2003 to correct PA field.)

"APC gene messenger KNA: novel isoforms that lack exon 7.";
Cancer Res. 53:5589-5591 (1993).
-!- FUNCTION: Tumor suppressor. Promotes rapid degradation of CTINNB1 and participates in Wnt signaling. APC activity is correlated with its phosphorylation state (By similarity).
-!- SUBUNIT: Forms homooligomers. Associates with catenins. Binds
                                                                                                                                                                             GAESKTLIYQMAPAVSRTEDVWVRIEDCPINNPRSGRSPTGNTPPVIDSISEKGNPSIKD

bridging between microtubules and other skeletal elements.
SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate with MAPIA and MAPIB proteins.
TISSUE SPECIFICITY: BRAIN, HEART AND MUSCLE.
DEVELOPMENTAL STRGE: EXPRESSED LATE DURING NEURONAL DEVELOPMENT APPEARING WHEN AXONS AND DENDRITES BEGIN TO SOLIDIFY AND STABILIZE
                                                                                                                                                                                     THEIR MORPHOLOGY.

-1- DOWALN: THE basic region containing the repeats may be responsible for the binding of MAPIA to microtubules.
-1- PTM: LC2 the binding of MAPIA to microtubules.
-1- PTM: LC2 IS CORRERESSED WITH MAPIA. IT IS A POLYPEPTIDE GENERATED FROM MAPIA BY PROTECLYTIC PROCESSING. IT IS FREE TO ASSOCIATE WITH BOTH MAPIA AND MAPIB.
-1- SIMILARITY: TO MAPIB.
